WO 2019/245893 A3

-1-

GIP/GLP1 AGONIST COMPOSITIONS

The present invention is a pharmaceutical GIP/GLP1 co-agonist peptide composition for subcutaneous injection. The composition comprises tirzepatide, NaCl, and dibasic sodium phosphate. The composition provides commercially acceptable shelf-
5 life stability, in-use stability, and is associated with acceptable patient injection site experience. An alternative composition comprises tirzepatide, propylene glycol, and dibasic sodium phosphate that also provides acceptable shelf-life stability.

Diabetes mellitus is a chronic disorder characterized by hyperglycemia resulting from defects in insulin secretion, insulin action, or both. In type 2 diabetes mellitus
10 (“T2D”), the combined effects of impaired insulin secretion and insulin resistance are associated with elevated blood glucose levels. Tirzepatide is a GIP/GLP1 co-agonist peptide useful in the treatment of diabetes. Tirzepatide is useful in the treatment of obesity.

US9474780 generally describes compositions containing a GIP/GLP1 agonist,
15 administered by parenteral routes. US9474780 describes and claims tirzepatide. There is a desire for compositions of tirzepatide providing acceptable stability and acceptable patient injection site experience.

The present invention seeks to meet these needs by providing pharmaceutically-acceptable compositions of tirzepatide, or a pharmaceutically acceptable salt thereof;
20 comprising an agent selected from the group consisting of NaCl and propylene glycol; and dibasic sodium phosphate.

In an embodiment, the agent is NaCl. In an embodiment, the NaCl concentration is from about 6.2 mg/mL to about 9.5 mg/mL. In an embodiment the NaCl concentration is from about 7.0 mg/mL to about 9.0 mg/mL. In an embodiment, the NaCl concentration
25 is about 8.2 mg/mL.

In an embodiment, the agent is propylene glycol. In an embodiment, the propylene glycol concentration is from about 12.0 mg/mL to about 18.0 mg/mL. In an embodiment the propylene glycol concentration is from about 14.0 mg/mL to about 16.0 mg/mL. In an embodiment, the propylene glycol concentration is about 15.0 mg/mL.

30 In an embodiment, the dibasic sodium phosphate concentration is from about 0.67 mg/mL to about 2.68 mg/mL. In an embodiment, the dibasic sodium phosphate is about

-2-

1.0 mg/mL to about 3.0 mg/mL. In an embodiment, the dibasic sodium phosphate is about 1.34 mg/mL.

In an embodiment, the tirzepatide concentration is from about 5 mg/mL to about 30 mg/mL and the agent is NaCl. In an embodiment, the tirzepatide concentration is from about 10 mg/mL to about 30 mg/mL. In an embodiment, the tirzepatide concentration is from about 5 mg/mL to about 30 mg/mL; the NaCl concentration is about 8.2 mg/mL, and dibasic sodium phosphate concentration is from about 0.67 mg/mL to about 2.68 mg/mL. In an embodiment, the tirzepatide concentration is from about 5 mg/mL to about 30 mg/mL; the NaCl concentration is about 8.2 mg/mL, dibasic sodium phosphate concentration is from about 0.67 mg/mL to about 2.68 mg/mL, and the composition is presented in a single use automatic injection apparatus.

In an embodiment, the tirzepatide concentration is from about 5 mg/mL to about 30 mg/mL; and the agent is propylene glycol. In an embodiment, the tirzepatide is from about 5 mg/mL to about 30 mg/mL; the propylene glycol is from about 12.0 mg/mL to about 18.0 mg/mL, and the dibasic sodium phosphate concentration is about 1.34 mg/mL. In an embodiment, the tirzepatide concentration is from about 5 mg/mL to about 30 mg/mL; the propylene glycol is about 15.0 mg/mL, and the dibasic sodium phosphate concentration is about 1.34 mg/mL.

In an embodiment, the tirzepatide concentration is from about 5 mg/mL to about 30 mg/mL. In certain embodiments, the tirzepatide concentration is from about 10 mg/mL to about 30 mg/mL. In an embodiment the tirzepatide concentration is selected from the group consisting of 5, 10, 15, 20, 25, and 30 mg/mL. In an embodiment, 0.5 mL or less of the composition is administered as a dose. In an embodiment, the tirzepatide concentration is selected from the group consisting of 10, 20, and 30 mg/mL.

In an embodiment, the tirzepatide composition further comprises a preservative. In an embodiment, the tirzepatide composition comprises tirzepatide, dibasic sodium phosphate, propylene glycol, and a preservative. In an embodiment, the preservative is selected from the group consisting of metacresol and phenol. In an embodiment, the metacresol concentration is from about 2.0 mg/mL to about 4.0 mg/mL. In an embodiment the metacresol concentration is from about 3.0 mg/mL to about 3.5 mg/mL. In an embodiment, the metacresol concentration is about 3.15 mg/mL. In an embodiment, the phenol concentration is from about 3.0 mg/mL to about 7.0 mg/mL. In

an embodiment the phenol concentration is from about 4.0 mg/mL to about 6.0 mg/mL. In an embodiment, the phenol concentration is about 5.0 mg/mL. In an embodiment, a tirzepatide composition is provided wherein tirzepatide concentration is from about 5mg/mL to about 30 mg/mL; propylene glycol concentration is from about 12.0 mg/mL to about 18.0 mg/mL; dibasic sodium phosphate concentration is from about 0.67 to about 2.68 mg/mL; and metacresol concentration is from about 2.0 mg/mL to about 4.0 mg/mL. In an embodiment, the metacresol concentration is about 3.15 mg/mL. In an embodiment, a tirzepatide composition is provided wherein tirzepatide concentration is from about 5 mg/mL to about 30 mg/mL; propylene glycol concentration is from about 12.0 mg/mL to about 18.0 mg/mL; dibasic sodium phosphate concentration is from about 0.67 to about 2.68 mg/mL; and phenol concentration is from about 3.0 mg/mL to about 7.0 mg/mL. In an embodiment, a tirzepatide composition is provided wherein tirzepatide concentration is from about 5 mg/mL to about 30 mg/mL; propylene glycol concentration is from about 12.0 mg/mL to about 18.0 mg/mL; dibasic sodium phosphate concentration is from about 0.67 to about 2.68 mg/mL; and phenol concentration is about 5.0 mg/mL.

In an embodiment, the dose of a tirzepatide composition is administered about once weekly. In an embodiment, the dose of a tirzepatide composition is administered once every seven days.

In an embodiment, there is provided a method of treating diabetes comprising administering to a human in need thereof an effective dose of one of the above-described compositions.

In an embodiment, there is provided a method of treating obesity comprising administering to a human in need thereof an effective dose of one of the above-described compositions. In an embodiment, there is provided a method of providing therapeutic weight loss comprising administering to a human in need thereof an effective dose of one of the above-described compositions. In an embodiment, there is provided a method of treating a condition mediated by GIP/GLP1 co-agonist activity comprising administering to a human in need thereof an effective dose of one of the above-described compositions.

In an embodiment, there is provided one of the above-described compositions for use as a medicament.

In an embodiment, there is provided one of the above-described compositions for use in the treatment of diabetes. In an embodiment, there is provided one of the above-described compositions for use in the treatment of obesity.

In an embodiment, there is provided one of the above-described compositions for use in providing therapeutic weight loss. In an embodiment, there is provided one of the above-described compositions for use in providing non-therapeutic weight loss.

According to another aspect of the present invention, there is provided an article of manufacture comprising one of the above-described compositions. In certain embodiments, the article of manufacture is a multi-use vial. In certain embodiments, the article of manufacture is a pre-filled syringe. In certain embodiments, the article of manufacture is an automatic injection apparatus (“auto-injector”). An example of an auto-injector, as contemplated herein, is presented in U.S. Patent 8,734,394.

As used herein, “tirzepatide” means a GIP/GLP1 co-agonist peptide as described in US 9,474,780 and described by CAS Registry Number: 2023788-19-2.

Tirzepatide is described in Example 1 of US 9474,780, with the following sequence:
YX₁EGTFTSDYSIX₂LDKIAQKAFVQWLIAGGPSSGAPPPS

wherein X₁ is Aib; X₂ is Aib; K at position 20 is chemically modified through conjugation to the epsilon-amino group of the K side-chain with (2-[2-(2-Amino-ethoxy)-ethoxy]-acetyl)₂-(γGlu)₁-CO-(CH₂)₁₈-CO₂H; and the C-terminal amino acid is amidated as a C-terminal primary amide (SEQ ID NO: 1).

When used herein, “pharmaceutically acceptable salt” is well known to the skilled artisan. In an embodiment is a pharmaceutically acceptable salt that is a tirzepatide trifluoroacetate salt.

When used herein, the term “does not contain a surfactant” means that the composition contains no added surfactant agents, or contains only a *de minimis* quantity of an added surfactant.

When used herein the term “propylene glycol” is well known to the skilled artisan. Propylene glycol is also represented by the formula: C₃H₈O₂.

The compositions of the present invention have concentrations of tirzepatide between 5 mg/mL and 30 mg/mL. The compositions of the present invention are likely to have specific concentrations of 5, 10, 15, 20, 25, and 30 mg/mL. Such compositions may be presented in a pre-filled syringe. Such pre-filled syringe may be useful for

administering one half milliliter of such composition per patient per dose. A dose of tirzepatide composition may be administered using a dosing schedule determined by a physician.

The compositions are sterile when first produced. If provided in a multi-use vial
5 or cartridge, an anti-microbial preservative compound or mixture of compounds that is compatible with the other components of the composition may be added at sufficient strength to meet applicable regulatory anti-microbial preservative requirements. Pharmaceutically acceptable preservatives are well-known in the art. (See, e.g., Remington: The Science and Practice of Pharmacy (D.B. Troy, Editor, 21st Edition,
10 Lippincott, Williams & Wilkins, 2006). In an embodiment, the preservative is meta-cresol. In an embodiment, the preservative is phenol. A composition for single use pre-filled syringe requires no preservative. In an embodiment, the composition does not contain a surfactant.

The pH of tirzepatide compositions of the present invention is typically 6.5 to 7.5
15 and it is adjusted using physiologically appropriate acids and bases, as may be required to achieve the desired pH. In an embodiment, the pH target is between 6.7 and 7.3. Patient injection site experience is a consideration for a subcutaneously administered composition. It is desirable to select a composition associated with an acceptable patient injection site experience. For example, NaCl and citrate have been associated with
20 painful stinging at the injection site. (Laursen, T.; Hansen, B.; Fisker, S. Pain perception after subcutaneous injections of media containing different buffers. *Basic & Clinical Pharmacology & Toxicology* **2006**, *98*, (2), 218-221.), (Fransson, J.; Espander-Jansson, A. Local tolerance of subcutaneous injections. *Journal of Pharmacy and Pharmacology* **1996**, *48*, (10), 1012-1015.) It is further desirable to match the tonicity (i.e., osmolality)
25 of body fluids at the injection site as closely as possible when administering the compositions because solutions that are not approximately isotonic with body fluids can produce a painful stinging sensation when administered. It is desirable that the compositions be approximately isotonic with body fluids at the sites of injection. The present composition comprising tirzepatide, NaCl, and dibasic sodium phosphate is
30 associated acceptable patient injection site experience. Likewise, the composition comprising tirzepatide, propylene glycol, and dibasic sodium phosphate is associated with acceptable patient injection site experience.

In an embodiment, the pH is adjusted using a base to facilitate dissolution in the buffer solution. The addition of an acid to the composition may be required to adjust the pH to the desired pH range. In an embodiment, NaOH is used to facilitate dissolution of tirzepatide in a buffer. In an embodiment, HCl is added to adjust the pH of the composition containing the dissolved tirzepatide to the desired pH range.

The compositions of the present invention are typically administered subcutaneously. The compositions are typically administered using a pre-filled, disposable pen, reusable pen, or automatic pen injector. The composition may be administered using a multi-use vial or a pump device. In an embodiment, the device is an automatic injection apparatus as claimed by U.S. Patent 8,734,394.

A composition comprising tirzepatide, NaCl, and dibasic sodium phosphate provides a desired shelf life stability and provides patients with an acceptable injection site experience. Likewise, a composition comprising tirzepatide, propylene glycol, and dibasic sodium phosphate provides a desired shelf life stability and provides patients with an acceptable injection site experience. As used herein, “shelf life stability” is measured under controlled conditions at about 5 degrees Celsius. A composition comprising tirzepatide, NaCl, and dibasic sodium phosphate provides acceptable in-use stability. Likewise, a composition comprising tirzepatide, propylene glycol, and dibasic sodium phosphate provides acceptable in-use stability. As used herein, the term “in-use stability” refers to the stability of the composition measured under controlled conditions at or about 25 degrees Celsius or at or about 40 degrees Celsius.

Example #1 – Composition containing NaCl

The composition is prepared substantially as described herein. The compositions containing 5, 10, 15, 20, 15, and 30 mg/mL of tirzepatide each contain the ingredients set forth in Table 1. Acid or base is optionally added to attain the desired pH range. Water is added *quantum satis* (*q.s.*) to one milliliter total final volume.

Table 1. Formulation of Tirzepatide, Phosphate, and NaCl

Example #2 – Composition containing Propylene glycol

The composition is prepared substantially as described herein. The compositions providing 5, 10, 15, 20, 15, and 30 mg/mL compositions of tirzepatide each contain the ingredients set forth in Table 2. Acid or base is optionally added to attain the desired pH range. Water is added *quantum satis* to one milliliter total final volume.

10 Size Exclusion Chromatography (SEC) In-Use Stability Study

This procedure is an isocratic size exclusion HPLC method with UV detection at 214 nm and is designed to determine the relative amounts of tirzepatide monomer and total aggregates. Monomer and aggregates are reported as peak area percent to the total area. The procedure is stability indicating as measured by its ability to resolve known impurities from tirzepatide. This study compares alternate compositions with the compositions of this invention, prepared as shown by Table 3. The stability from this study is shown in Table 4.

20 Stability study comparing alternate compositions:

Shelf Life Stability Study**RP-HPLC:**

This procedure is a gradient reversed-phase HPLC method with UV detection at 214 nm and is designed to determine the quantity, identity, and purity of tirzepatide in the drug product. Identity is determined by matching the retention time of the main peak with that of the main peak of an external reference standard. Quantity is determined by the comparison of the main peak area with the corresponding peak in the external reference standard. Impurities and related substances are reported as peak area percent to the total peak area. The procedure is stability indicating as judged by its ability to resolve known impurities from tirzepatide. As shown by Table 4, a composition comprising NaCl as a tonicity agent provides acceptable in-use stability.

15

Size Exclusion Chromatography (SEC) Shelf-Life Stability Study

The size exclusion stability study methods and RP-HPLC described herein above are applied to compare compositions comprising NaCl as a tonicity and stabilizing agent with compositions comprising propylene glycol as a tonicity and stabilizing agent. This study illustrates the acceptable shelf-life stability of a composition of this invention comprising NaCl agent or comprising propylene glycol as agent. The compositions used for this study are set forth in Table 5. The stability from this study is shown in Table 6.

Pain upon injection study:

All compositions are prepared as described by Table 7. Each solution composition vial is held at room temperature about 30 minutes, but not more than four hours. Reconstituted lyophilized compositions are used immediately. All injections are rotated between the 4 quadrants of the abdomen, in the following order; lower left quadrant; lower right quadrant; upper left quadrant; and upper right quadrant. A syringe with a 29 gauge needle is used to administer the composition from a vial. A fold of skin at the injection site is grasped by the subject, and the needle is inserted at about a 45 degree angle. A second person uses a stop watch to measure the length of time of injection. The subject slowly pushes the plunger of the syringe all the way until 0.5 mL of the composition is injected. The target time of injection is 4 seconds duration, and not more than 5 seconds. The needle is removed from the skin after injection and skin is released from the subject's grasp. The subject immediately assesses the pain after each injection. Pain measurements are assessed using a 100-mm validated visual analog scale (VAS) for pain. The VAS is a well-validated tool to assess injection-site pain (Williamson, A.; Hoggart, B. Pain: A review of three commonly used pain rating scales. *Journal of Clinical Nursing* **2005**, *14*, (7), 798-804). The VAS is presented as a 10-cm (100-mm) line, anchored by verbal descriptors, usually "no pain" and "worst imaginable pain." The subject is asked to mark the 100-mm line to indicate pain intensity at time points and as clinically indicated. A staff member uses a caliper to measure the distance from 0 to the mark that the subject placed on the VAS, and to record the measurement in the source document. Results from this study appear in Table 8. An acceptable patient injection site experience is reflected by a mild pain intensity indication (compared to moderate or severe).

WE CLAIM:

1. A pharmaceutical composition comprising
tirzepatide, or a pharmaceutically acceptable salt thereof;
an agent selected from the group consisting of NaCl and propylene glycol; and
dibasic sodium phosphate.
5
2. A pharmaceutical composition as claimed by Claim 1, wherein the
tirzepatide, or a pharmaceutically acceptable salt thereof, concentration is
from about 5 to about 30 mg/mL.
3. A pharmaceutical composition as claimed by Claim 2
10 wherein the dibasic sodium phosphate concentration is from about 1.0 mg/mL
to about 3.0 mg/mL.
4. A pharmaceutical composition as claimed by Claim 3 wherein the
dibasic sodium phosphate concentration is from about 0.67 mg/mL to
about 2.68 mg/mL.
- 15 5. A pharmaceutical composition as claimed by Claim 4 wherein the dibasic
sodium phosphate concentration is about 1.34 mg/mL.
6. A pharmaceutical composition as claimed by Claim 1 wherein the
tirzepatide, or a pharmaceutically acceptable salt thereof, concentration is
selected from the group consisting of 5, 10, 15, 20, 25, and
20 30 mg/mL.
7. A pharmaceutical composition as claimed by Claim 6 wherein the
tirzepatide, or pharmaceutically acceptable salt thereof, concentration is
selected from the group consisting of 10, 20, and 30 mg/mL.
8. A pharmaceutical composition as claimed by Claim 7
25 wherein the agent is NaCl.
9. A pharmaceutical composition as claimed by Claim 8 wherein the
concentration of NaCl is from about 6.2 mg/mL to about 9.5 mg/mL.
- 30 10. A pharmaceutical composition as claimed by Claim 9
wherein the concentration of NaCl is from about 7.0 mg/mL to about 9.0
mg/mL.

-14-

11. A pharmaceutical composition as claimed by Claim 10 wherein the NaCl concentration is about 8.2 mg/mL.
12. A pharmaceutical composition as claimed by Claim 1 wherein tirzepatide, or pharmaceutically acceptable salt thereof, concentration is from about 5
5 mg/mL to about 30 mg/mL; dibasic sodium phosphate concentration is from about 0.67 mg/mL to about 2.68 mg/mL; and NaCl concentration is from about 6.2 mg/mL to about 9.5 mg/mL.
13. A pharmaceutical composition as claimed by Claim 12 wherein tirzepatide, or pharmaceutically acceptable salt thereof, concentration is from about 5
10 mg/mL to about 30 mg/mL; dibasic sodium phosphate concentration is about 1.34 mg/mL; and NaCl concentration is about 8.2 mg/mL.
14. A pharmaceutical composition as claimed by Claim 13 wherein the composition is presented in an automatic injection apparatus.
15. A pharmaceutical composition as claimed by Claim 1
15 wherein the agent is propylene glycol.
16. A pharmaceutical composition as claimed by Claim 15 wherein the concentration of propylene glycol is from about 12.0 mg/mL to about 18.0 mg/mL.
17. A pharmaceutical composition as claimed by Claim 16 wherein the
20 concentration of propylene glycol is from about 14.0 mg/mL to about 16.0 mg/mL.
18. A pharmaceutical composition as claimed by Claim 17 wherein the concentration of propylene glycol is about 15.0 mg/mL.
19. A pharmaceutical composition as claimed by Claim 1 wherein tirzepatide, or
25 pharmaceutically acceptable salt thereof, concentration is from about 5 mg/mL to about 30 mg/mL; dibasic sodium phosphate concentration is from about 0.67 mg/mL to about 2.68 mg/mL; and propylene glycol concentration is from about 14.0 mg/mL to about 16.0 mg/mL.
20. A pharmaceutical composition as claimed by Claim 19 wherein tirzepatide, or
30 pharmaceutically acceptable salt thereof, concentration is from about 5 mg/mL to about 30 mg/mL; dibasic sodium phosphate concentration is about 1.34 mg/mL; and propylene glycol concentration is about 15.0 mg/mL.

-15-

21. A pharmaceutical composition as claimed by Claim 20 wherein the composition is presented in an automatic injection apparatus.
22. A pharmaceutical composition as claimed by Claim 21 wherein the pH of the composition is from about 6.5 to about 7.5.
- 5 23. A pharmaceutical composition as claimed by Claim 22 wherein the pH is from about 6.7 to about 7.3.
24. A pharmaceutical composition as claimed by Claim 23 further comprising one or more preservatives.
25. A pharmaceutical composition as claimed by Claim 24
10 wherein the composition further comprises a preservative selected from the group consisting of metacresol and phenol.
26. A pharmaceutical composition as claimed by Claim 25 wherein the preservative is metacresol.
27. A pharmaceutical composition as claimed by Claim 26 wherein the
15 metacresol concentration is from about 2.0 mg/mL to about 4.0 mg/mL.
28. A pharmaceutical composition as claimed by Claim 27 wherein the metacresol concentration is about 3.15 mg/mL.
29. A pharmaceutical composition as claimed by Claim 25 wherein the preservative is phenol.
- 20 30. A pharmaceutical composition as claimed by Claim 29 wherein the phenol concentration is from about 3.0 mg/mL to about 7.0 mg/mL.
31. A pharmaceutical composition as claimed by Claim 30 wherein the phenol concentration is about 5.0 mg/mL.
32. A pharmaceutical composition as claimed by Claim 1 wherein tirzepatide, or
25 pharmaceutically acceptable salt thereof, concentration is from about 5 mg/mL to about 30 mg/mL; dibasic sodium phosphate is from about 0.67 to about 2.68 mg/mL; propylene glycol is from about 12.0 mg/mL to about 15.0 mg/mL; and further comprising from about 2.0 mg/mL to about 4.0 mg/mL metacresol.
- 30 33. A pharmaceutical composition as claimed by Claim 1 wherein tirzepatide, or pharmaceutically acceptable salt thereof, concentration is from about 5 mg/mL to about 30 mg/mL; dibasic sodium phosphate is from about 0.67 to

-16-

about 2.68 mg/mL; propylene glycol is from about 12.0 mg/mL to about 18.0 mg/mL; and further comprising from about 3.0 mg/mL to about 7.0 mg/mL phenol.

34. A pharmaceutical composition as claimed by Claim 33
5 wherein the volume of the composition dose is about 0.5 mL.
35. A pharmaceutical composition as claimed by Claim 34 wherein the composition is administered using an automatic injection apparatus.
36. A method of treating diabetes comprising administering to a human in need
10 thereof an effective dose of the pharmaceutical composition as claimed by Claim 33.
37. A method of treating diabetes as claimed by Claim 36 wherein the dose is administered using an automatic injection apparatus.
38. A method of treating diabetes as claimed by Claim 37 wherein the dose
15 is administered once weekly.
39. A method of treating obesity comprising administering to a human in need thereof an effective dose of the pharmaceutical composition as claimed by Claim 33.
40. A method of treating obesity as claimed by Claim 39 wherein the dose is
20 administered using an automatic injection apparatus.
41. A method of treating obesity as claimed by Claim 40 wherein the dose is administered once weekly.
42. A pharmaceutical composition as claimed by Claim 33 for use in the
25 treatment of diabetes.
43. A pharmaceutical composition as claimed by Claim 33 for use in the treatment of obesity.
